

Administration / Distribution of Naloxone by PTs

Purpose

This advisory statement clarifies the roles physical therapists may have in administering and/or distributing naloxone. Specifically, it discusses the impact that amendments to the Health Professions General Regulation and the unscheduling of emergency use naloxone have on physical therapists' practice.

Background

In April 2016 British Columbia's provincial health officer declared a public health emergency in response to a significant rise in deaths from opioid-related overdoses.

Naloxone is a medication that is used to treat overdoses from opioids such as fentanyl, heroin, and morphine. Given the current public health emergency and naloxone's life-saving abilities, several federal and provincial initiatives have been taken to improve its access, including the ability for health professionals such as physical therapists to distribute and administer it.

Physical Therapy Roles Related to Naloxone

Physical therapists work in a variety of practice settings with individuals who are at risk of an opioid-related overdose (e.g., community settings, pain clinics). While the administration of medications remains out of scope for physical therapists, recent regulatory changes specific to emergency use of naloxone impact the following physical therapy roles:

Distribution of naloxone

In September 2016, emergency use of naloxone became unscheduled in British Columbia, effectively allowing emergency use naloxone to be "available anywhere and purchased by anyone" without a prescription). Given this change, when appropriate, physical therapists may distribute naloxone, typically as a take home kit, to their clients or their clients' friends and family. This is different than *dispensing* a scheduled medication which remains a restricted activity and out of scope for physical therapists.

Administration of naloxone

In October 2016, an amendment was made to the *Health Professions General Regulation (HPGR Section 9)* as follows:

“If a person who is not otherwise authorized to administer naloxone to another person suspects that another person is suffering from an overdose of opioids, the person may assess and treat the other person if treatment is limited to the emergency administration of

- (a) naloxone, by intramuscular injection or intranasally, and
- (b) first aid”.

Training

According to the BC Centre for Disease Control, best practice dictates that the administration and distribution of emergency use naloxone be accompanied by providing competency-based training, such as that offered by regional health authorities or [Toward the Heart’s training](#). This includes training by physical therapists to other health care professionals.

While these regulatory changes allow physical therapists to distribute and/or administer naloxone, employers (e.g., health authorities) may limit or more narrowly define a physical therapist’s role. Physical therapists are advised to speak with their leadership team and familiarize themselves with related employer policies, procedures, and processes.

Learn More

Physical therapists are accountable for obtaining and maintaining the necessary competencies to perform their roles. Given the potential risk factors associated with distributing and administering medications such as naloxone, physical therapists are advised to pay specific attention to completing any employer mandated and/or self-directed professional development in this area.

In addition to any employer-provided materials or training offered, the College offers a list of current naloxone-related resources below.

Definitions

Dispense includes the preparation and sale of a drug or device referred to in a prescription and taking steps to ensure the pharmaceutical and therapeutic suitability of a drug or device for its intended use and taking steps to ensure its proper use.
